PolyglotBooster User Manual

Last updated: November 4, 2026

PolyglotBooster is a study companion for learning languages through other languages. You give it a word, a sentence, or a whole document in the language you're learning; it explains it through a language you already know, reads it aloud, and turns it into Anki flashcards — including rich notes, audio, and new cards for the example sentences and related words it finds along the way.

App address: https://polyglotbooster-v2.vercel.app

9. Reference

1. Getting started

What you need

- A **Google account** — it's how you sign in.
- An **API key** from Anthropic (Claude), OpenAI (GPT), or both. PolyglotBooster uses *your* key for everything it generates, so you pay the AI provider directly for what you use — typically a few cents per analysis and well under a cent per audio clip. See section 2.
- For the Anki features: a **laptop or desktop computer** with the free **Anki** app. Everything else works on a phone or tablet too.

Signing in

Open https://polyglotbooster-v2.vercel.app and click **Sign in with Google**. Your keys, settings and saved reviews belong to your Google account, so you'll see the same things on any device you sign in from.

Installing it as an app (optional)

- **Chrome or Edge (computer):** click the install icon at the right end of the address bar, or the ⋮ menu → *Cast, save and share* → *Install page as app*.
- **iPhone / iPad (Safari):** tap Share → *Add to Home Screen*.
- **Android (Chrome):** ⋮ menu → *Add to Home screen* / *Install app*.

Finding your way around

The header at the top of every page has three links:

Link	What's there
Study desk (the home page)	Analyze text, hear it read aloud, save and export results. Its **Utilities** tab saves the clipboard for Anki later, lists what's saved for later, and organizes every saved session
Anki	Work directly with your Anki collection (computer only)
Settings	API keys and voices

2. Settings: API keys and voices

API keys

PolyglotBooster needs at least one key before it can run anything.

Getting an Anthropic (Claude) key

1. Go to https://console.anthropic.com and sign up or sign in.
2. Add a payment method and some credit under *Billing* (a few dollars lasts a long time).
3. Open *API Keys* → **Create Key**, and copy the key (it starts with `sk-ant-`).

Getting an OpenAI key — needed for audio (read-aloud and Anki audio), optional for analysis

1. Go to https://platform.openai.com and sign up or sign in.
2. Add credit under *Billing*.
3. Open *API keys* → **Create new secret key**, and copy it (it starts with `sk-`).

Adding them: in **Settings**, paste each key into its box and click **Save key**. The page then says *A key is on file*. Keys are stored encrypted on the server, tied to your account, and used only for your own requests. You can replace or remove a key at any time.

> Audio always uses OpenAI, whichever provider you pick for analysis — so if you want audio, add an OpenAI key.

Voices

Also in **Settings**, the **Voices** section chooses the voice for each language. Each language has:

- a **voice** (OpenAI's `marin` and `cedar` are the most natural), and
- **instructions** that set the accent and pace — e.g. "*Speak natural Central Thai with a native Bangkok accent and accurate tones…*". The voices aren't tied to a language; the instructions are what make them sound native.

Click **Preview** to hear a sample, adjust, then **Save voices**. The voices are used by the 🔊 button on the study desk and for all Anki audio.

Audio 2 is the second recording on an Anki card, which plays after the first. Under each language, **Audio 2** starts out automatic: a different voice from the one above, with the same instructions. Open it and change the voice or instructions to give that language its own (**Back to automatic** undoes this). You can also save a voice you like while recording: see Review & analyze and Bulk audio.

Thai pronunciation: the voice reads Thai largely from its spelling, so words with silent letters or hidden vowels would come out wrong (the silent ร in ศึกษะ sounded, for example). Before recording a Thai word, phrase or sentence (up to 300 characters), PolyglotBooster has the AI find the words that aren't read as

spelled and respell just those the way they sound — ศีรษะ → สีสะ, ผลไม้ → ผนละไม้ — guided by the note's romanization; every other word is left exactly as written. Only the recording uses the respelling; the Thai on your card keeps its correct spelling. It uses your Anthropic key if you have one (with Claude Sonnet 5.5, which gets the Thai tone rules right), otherwise OpenAI, and costs a fraction of a cent per recording. Longer passages are read as written. **Japanese pronunciation:** kanji often have several readings, and the voice can pick the wrong one for an unusual word (塔頭 read as *とうとう* instead of *たっちゅう*). So Anki audio for a Japanese note is recorded from its hiragana reading — the furigana shown on the card — when it has one. If a recording comes out wrong, check the reading in the **Reading** panel, then **Re-record**.

3. The study desk

The study desk (home page) is where you analyze anything in any supported language.

Step 1 — Set the languages

Across the top:

- **Source** — the language you're studying (Japanese, Thai, Indonesian, Spanish, English, French or Mandarin).
- **Explain through** — the language explanations are written in.
- **Level** — Beginner, Intermediate or Advanced; controls how much is assumed.
- **Style** — Concise, Detailed, Literal, Natural, Formal or Informal. *Concise* gives the essentials; *Detailed* goes deeper.

The app remembers your choices.

Step 2 — Give it something to study

Enter text: type or paste a word, sentence or passage (up to 12,000 characters). The **Try an example** buttons load a sample.

Your work in progress — the text, the chosen task and its result — is kept in this browser, so reloading or closing the page doesn't lose it. **Clear** empties it. It isn't shared between devices; use **Save for review** to keep a result in your account.

Upload document: click **Choose documents** and pick a DOCX, PDF, image (JPG, PNG, or HEIC — the iPhone camera's format), HTML, TXT or XML file (up to 4 MB each). HEIC photos are converted to JPG in your browser first, so iPhone photos synced to your PC (e.g. the **iCloud Photos** folder) can be picked as they are. You can select **several files at once** — for example every page of a chapter — and they're read one after another in filename order. In Chrome and Edge the picker reopens in the folder you used last. The text is extracted and placed in the text box, where you can edit it before running a task.

For photos, choose how they're read under **Read photos with** (the app remembers your choice):

- **This device first** — free. The photo is read in your browser; if that finds too little text, the AI reader is used instead. Works well for clear, printed text.
- **AI reader** — about a cent per photo. Best when a photo mixes scripts (for example Thai with its romanization and an English translation), has tone-marked romanization, or is handwritten or hard to read.

When there's already text in the box, **Add to the text already in the box** (on by default) appends new files instead of replacing the text, so you can also add pages in several goes (up to 12,000 characters in total).

You don't need to tidy up romanization or translations that come in with a photo: PolyglotBooster writes its own romanization, and when a note goes to Anki only the learning-language script is kept in that field. Deleting obviously garbled lines before you run a task still helps.

Choose the **Provider** (Anthropic or OpenAI) under the text box — the note beside it tells you whether you have a key on file for it.

Step 3 — Choose a task

Pick a task from the drop-down at the top of the panel or from the cards under **Choose a lens**. The tasks shown depend on the source language:

Language-specific tasks (shown first)

- **Word Analysis** — for a single word or short term: pronunciation, meanings, origin, how it's built, classifiers (Thai), related words, how it changes across registers from formal to slang, example sentences, and nuance.
- **Sentence Guide** — for a phrase, sentence or passage: pronunciation and meaning (literal and natural), with a word-by-word table, the reusable grammar pattern, register versions from formal to slang, alternative ways to say it, an opposite where there is one, and new example sentences.
- **Convert Thai Script** (Thai only).

General tasks (every language): Build vocabulary, Make flashcards (everything in the material — best for textbook pages), **Make flashcards (selective)** (only the vocabulary a learner at your level probably doesn't know yet, plus up to five key sentences, about 10–25 cards — best for articles and other longer texts), Convert register, Extract text exactly, Translate naturally, Explain grammar, Add reading support, Answer questions, and **Word-by-word** — a quick, abbreviated breakdown: each word with its reading and literal meaning, a short definition written in the learned language itself (translated in brackets), and one to three synonyms, ending with a word-for-word and a natural translation of the whole text.

Custom task (the last card, and the last choice in the drop-down) — for a one-off question no task covers: a box opens where you type what the AI should do with the text (e.g. *List every honorific in this text and explain who is being honored*). It's sent as the task, after the general instructions, and for Japanese with the dictionary reference too. A saved result keeps the instructions, shown when you expand it. **Save as a task…** turns them into a permanent task card.

> Thai romanization everywhere in the app uses one consistent style with tone marks, e.g. ยินดีที่ได้รู้จัก → *yin dee thêe dâi rúu jàk*.

Step 4 — Run it

- **Run task** sends it to the AI; the result appears below the text box.
- **Preview prompt** shows exactly what will be sent, without running it, in its parts:
    - **General instructions** — the opening every task shares, which works like a system prompt (PolyglotBooster sends one message, not a separate system prompt): the AI's role, your

languages, level and style, the general rules, and for Thai the romanization style;
    - **Task** — the task's own instructions (or your custom task);
    - **Dictionary reference** — for Japanese tasks, the JMdict and KANJIDIC2 entries added for the text;
    - **Source text**.

  Edit general instructions (in the preview) opens them in a box to change, e.g. to drop a rule that gets in the way of a custom task. While edited, they're used for every run — any task — until **Reset to default**; they're used as written, so if you change the languages, level or style, edit those lines too or reset. A saved result keeps the edited version. The Anki page's analyses always use the standard ones.

- 🔊 reads the source text aloud with your voice for that language, with play/pause, skip and loop controls.

Make flashcards turns the material into a complete set of cards — every vocabulary item (including glossary asides like "(kitchen = khruua)") and every example sentence — each with its meaning, a reading, and a short note from the material. You can change the front, back or tags, **Remove** cards, or **Add card**, then send them to Anki (below).

Step 5 — Ask follow-up questions

Under a result, click **Ask a follow-up question**, type your question (the **Insert a phrase** buttons give you starters such as "*What would be another way to say*"), then **Run task**. Answers stay attached to the result.

Step 6 — Save or send to Anki

- **Save for review** keeps the result (with any follow-ups and audio) in your saved reviews — see section 4.
- **Send to Anki** (shown for Indonesian, Thai, Japanese, Spanish, French or Mandarin explained in English; works on a computer with Anki set up) puts it straight into your Anki collection — see Send to Anki.
- **Send cards to Anki** does the same for a Make flashcards result — see Flashcards to Anki.
- **Right-click a phrase** in the result or a follow-up answer to add just that phrase to Anki — see Right-click to add a phrase.
- **Save for listening** (under the text box; no task needs running) saves the text, or just the part you've selected in it, to make listening notes from later. It works on any device. For example, read a textbook page with the AI reader on a tablet, fix the text, select the part you want and tap **Save for listening**. Then make the notes on the computer running Anki.

4. Saved reviews, exports and Utilities

The study desk shows your **5 most recent** saved results for the current source language at the bottom, with **All N saved sessions** → **Utilities** below them. Every saved session, in every language, is on the Utilities tab.

For each saved review you can:

- click it to expand the source text, result, follow-ups and audio;
- **Open full size on the study desk** ↑ — loads it back into the study desk above (replacing what's there) and scrolls up to it: the result is shown full size, ready to read, right-click phrases from, ask more follow-ups about, or re-save;
- add a **note** for yourself (saved when you click away);
- **Send to Anki**, or **Send cards to Anki** for a flashcard result (see section 6), or right-click a phrase in the expanded review to add just that;
- **Download TXT** — a plain-text copy;
- **Delete** it.

Cards reach Anki only through the Anki connection (Send to Anki and the Anki page) — there are no deck files to download and import.

Utilities

The study desk has two tabs at the top: **Study desk** and **Utilities**. Utilities has its own address (`/utilities`), so on the iPhone you can add it to the Home Screen (Share → **Add to Home Screen**) and open it in one tap.

Save clipboard for Anki later. Copy a word or phrase in any app — a chat, a web page, an e-book — then tap **Save clipboard for Anki later**. On the iPhone, Safari first shows a small **Paste** bubble: tap it (Apple asks every time before a website reads the clipboard). A dialog then shows exactly what was copied, before anything is saved:

- the text, editable — check it's what you meant and not something copied earlier, and trim it to the word or phrase to learn (up to 300 characters per item);
- the **language**, guessed from the script (Thai and Japanese kana are certain; Chinese characters alone, or Latin text, keep the language you used last) — change it if needed;
- **Seen in** (optional), e.g. *LINE chat* — it becomes the card's *Seen in:* line;
- **Save each of the N lines as a separate item**, when several lines were copied (a word list).

Save adds it to the same Saved for Anki later list as everything else; on the Anki page it's looked up as usual, with the whole copied text as its context. If the clipboard can't be read or is empty, the dialog opens with an empty box — long-press it and choose **Paste**.

Saved for Anki later — the list of what's waiting, with **Delete** for each (the study desk shows a one-line link to it).

Saved sessions — every saved session, in every language:

- **Search** the source text, results, follow-ups, notes and titles; filter by **language** and **task**; sort **newest** or **oldest first**.
- Each row shows the title (or first line), languages, task name, card count for flashcard results, and date. Click one to expand it, as on the study desk.
- Give a session a **title** (e.g. *Eijuin article, selective cards*), shown instead of its first line; add a **note**.
- **Open on the study desk** loads it on the study desk, ready to read, right-click, ask follow-ups or send to Anki.
- **Download TXT**, **Delete** one, or tick several (or **Select all N shown**) and **Delete N selected**.

5. Setting up Anki (first-time Anki users)

Anki is a free flashcard app that schedules each card just before you'd forget it. PolyglotBooster works directly with the Anki app on your computer. You do this setup **once per computer**.

5.1 Install Anki

1. Download Anki from https://apps.ankiweb.net (Windows, Mac or Linux) and install it.
2. Open Anki. On first launch it asks for your language and creates a profile.
3. *(Recommended)* Create a free **AnkiWeb** account at https://ankiweb.net, then in Anki click **Sync** and sign in. Syncing backs up your cards and lets you study on your phone — see section 7.

5.2 Install the AnkiConnect add-on

AnkiConnect lets PolyglotBooster talk to Anki.

1. In Anki: **Tools** → **Add-ons** → **Get Add-ons...**
2. Enter the code `2055492159` and click **OK**.
3. **Restart Anki.**

5.3 Allow PolyglotBooster to connect

1. In Anki: **Tools** → **Add-ons**, select **AnkiConnect**, and click **Config**.
2. Find the `"webCorsOriginList"` setting and make it look exactly like this:

   ```
   "webCorsOriginList": [
       "http://localhost",
       "https://polyglotbooster-v2.vercel.app"
   ]
   ```

   Every line inside the brackets except the last ends with a comma — without the commas Anki won't save the configuration.
3. Click **OK** and **restart Anki**.

5.4 Create the PolyglotBooster note type

1. With Anki open, go to the **Anki** page in PolyglotBooster.
2. If your browser asks to let the site access devices on your local network, click **Allow** — that's how it reaches Anki.
3. The page shows **Connected — setup needed**. Click **Set up Polyglot Vocab**.

This adds, without touching anything already in Anki:

- a note type called **Polyglot Vocab**, and
- a deck for each language: **Polyglot::Indonesian**, **::Thai**, **::Japanese**, **::Spanish**, **::French** and **::Mandarin**.

It includes listening cards; their decks (**Polyglot::Listening::***Language*) are made when you add your first listening note.

The page then shows **Connected to Anki**, and you're ready.

5.4a Adding Spanish, French and Mandarin to an older setup

If you set up Polyglot Vocab before these languages were added, the Anki page shows a panel offering to **Add Spanish, French, Mandarin**. It adds their fields, their card directions and their decks, without changing your existing notes or cards (it also repairs an older card-layout glitch on a few card directions).

1. **Sync your phone first** — the change needs a one-way sync, and anything not yet synced from the phone would be lost.
2. Click **Add Spanish, French, Mandarin**.
3. Sync Anki on your computer; when it asks, choose **Upload to AnkiWeb**. Then sync your phone.

5.4b Adding listening cards to an older setup

If you set up Polyglot Vocab before listening cards existed, the Anki page offers **Add listening cards**. It adds a second audio field for each language, the *Listening* and *ListeningOnly* fields and a listening card for each language, and lets every card play the second recording after the first. Your existing notes and cards stay as they are. Follow the same three steps as above: sync your phone first, click the button, then upload from your computer and sync your phone.

When a later version of PolyglotBooster improves the listening cards, the page shows **Update listening cards** instead. It only replaces the listening card layouts, so afterwards an ordinary sync is enough (Anki won't ask to upload); sync your computer, then your phone.

5.5 How Polyglot Vocab notes work

One note holds one item in several languages. Its fields are:

Field	Holds
English, Indonesian, Thai, Japanese, Spanish, French, Mandarin	The item in each language
Audio_*Language*	That language's recording
Audio2_*Language*	An optional second recording (another voice, or the textbook's), played after the first
Notes_*Language*	The reading (Thai romanization, Japanese furigana or Mandarin pinyin), the analysis, and brief explanations written in that language
Notes_English (*English note*)	Brief explanations in English, and anything you write yourself, e.g. a question when flagging a card
Origin	The language the item was first learned in
Listening	Filled in (e.g. *yes*): the note also gets a listening card for each of its languages that has audio
ListeningOnly	Filled in on a paragraph made on the *Listening* tab: the note gets only listening cards, not the usual directions

Anki creates a **card for each language direction** that has both sides filled in — for example a note with English and Thai gives you *English → Thai* and *Thai → English* cards. Fill in Japanese later and the Japanese directions appear automatically.

Card directions exist between each language and English, plus Indonesian–Thai, Indonesian–Japanese, Thai–Japanese, Spanish–French, Mandarin–Japanese and Mandarin–Thai.

Cards with English go in that language's deck (an *English → Spanish* card in **Polyglot::Spanish**); cards between two languages go in **Polyglot::Cross-Language::***A-B* (e.g. **Cross-Language::Thai-Mandarin**). When PolyglotBooster saves a note, it puts any new cards in those decks. When you fill in a language directly in Anki or on your phone, Anki puts the new cards in the right deck only if that card direction has a *deck override* (Anki: **Tools → Manage Note Types → Polyglot Vocab → Cards → Options → Deck Override**); without one, they land in the deck of the note's other cards.

Chinese characters: Mandarin is entered in simplified characters. Its reading under **more** shows the pinyin, then the other script — *Traditional:* for simplified text, or *Simplified:* if you entered traditional text from Taiwan or Hong Kong — and, for words, the *Japanese kanji* form when it differs (e.g. 经济 → 経済). On a Japanese note that also has Mandarin, the reading adds the *Simplified Chinese* form of the kanji. These are character-form conversions, not translations.

On each card, the audio plays automatically (both recordings, one after the other, if the note has two; press space to show the answer and skip the rest) and the notes are tucked under a **more** link, so the card stays clean until you want the detail.

> **Adding notes by hand in Anki:** click **Add**, choose the *Polyglot Vocab* note type, fill in English plus at least one other language, and set *Origin* to that language.

6. The Anki page

The Anki page works on a **computer with Anki open**. At the top it shows the connection status; once connected it has six tabs: **Review & analyze**, **Bulk audio**, **Book audio**, **Phrase clip transcripts**, **Listening** and **Tags**.

6.1 Review & analyze

This is where you enrich notes one at a time — which doubles as a study session.

Choose what to work on

- **Language** — Indonesian, Thai, Japanese, Spanish, French or Mandarin. **Start session** only brings up notes whose *Origin* is this language (an Indonesian-origin note that also has Thai comes up in Indonesian sessions); **Flagged in Anki**, **Find** and **Review tag** show every note with this language filled in, whatever its origin.
- **Narrow with an Anki search** *(optional)* — any Anki search, e.g. `tag:food` or `deck:Polyglot::Thai`.
- **Model, Level, Style** — the provider and settings for the analysis (defaults: Anthropic, Intermediate, Concise).
- **Start session** — works through notes that haven't been analyzed yet, plus analyzed notes whose field still needs cleaning up (e.g. an old romanization in the Thai field), oldest first.
- **Flagged in Anki** — works through notes you've red-flagged in Anki (see below), analyzed or not.
- **Missing romanization** (Thai) / **Missing reading** (Japanese, Mandarin) — every note with that language filled in but no reading yet, **newest first**: notes you made in Anki itself, notes marked *Never analyze*, and languages added to a note later. Each note's reading is written as soon as it comes up; check or edit it, then **Save changes & next**, which saves only the reading — the note isn't marked as analyzed, and anything else in its Notes field stays as it was. You can still **Analyze** a note here if you want the full analysis too.
- **Or find a note to edit** — type Thai/Indonesian/Japanese or English text and click **Find**; this works for any note, analyzed or not, and opens its saved analysis for editing.
- **Or review every note with a tag** — pick or type a tag (e.g. *source::STT::24*) and click **Review tag** to go through every note with it, analyzed or not, in the order they were added — e.g. to look over a chapter's cards. A tag also covers the tags nested under it, so *source::STT* brings up every chapter of that book. (The *Narrow with an Anki search* box, by contrast, only narrows **Start session**, which brings up notes not yet analyzed.)

Working on a note

Every note opens with the same tools, however you got to it (a session, **Flagged in Anki**, **Missing romanization**, **Find**, **Review tag**), each showing what the card has now — so a finished card can be fixed just as easily as a new one analyzed:

1. **The card** — the learning-language text, and **Show English** to reveal the meaning when you're ready (try recalling it first). Under it, the **English note** (*Notes_English*), e.g. a question you typed in

Anki when you flagged the card: edit it, or empty it to delete it.

2. **Clean up the field** *(when needed)* — older notes sometimes contain formatting or an old romanization in the language field. The page shows the stored version and a cleaned version you can edit; tick **Replace the field on save** to fix it. **Dictionary (JMdict)** *(Japanese notes)* — the curated dictionary entry for the word, no AI: its readings, a **common** badge for everyday words, numbered senses with part-of-speech tags (hover a tag for its meaning) and, for many senses, a real example sentence with its English translation (from Tatoeba), and each kanji's meanings, on/kun readings, school grade and stroke count, with other words that use it (熟語) as Imiwa shows them — everyday words first (e.g. 離: 分離, 距離, 離陸, 離婚 …). For a **sentence**, the panel lists its words instead — each in its dictionary form (with the form used in the sentence), reading, common badge and main meanings — and then only its **hardest kanji** with their compounds (see the rule). A word that isn't in the dictionary as a whole — e.g. 唱題行 — is shown as the dictionary words it's made of (唱題 + 行). The same panel appears when you add an item (branching, right-click, flashcards, Saved for later). The data is the same as the Imiwa app's — see Dictionary data.

3. **Romanization** (Thai) / **Reading** (Japanese, Mandarin) — the card's current reading: edit it, or **Regenerate** it (the button beside the heading). For Japanese it's the hiragana shown as furigana on the card. (A Japanese note whose furigana was written by hand in Anki keeps it as it is; the panel shows its kana.)

4. **Audio** — beside the heading: ▶ **Current** (the ▶ **2** next to the text plays the second recording), **Re-record** for a new take (Thai is respelled for the voice so silent letters stay silent), and **Choose file…** to use an audio file instead, e.g. a textbook's recording (MP3, M4A, AAC, WAV, OGG or FLAC, up to 20 MB; MP3 and M4A play everywhere, including AnkiMobile). On a computer you can also drag the file onto the Audio section. A new take or file plays straight away; ▶ **New** plays it again, **Record again** tries once more, and **Keep the old one** drops it. The line below shows the file in the card's Audio field, e.g. `[sound:pb-1690…-thai.mp3]`, and what it will be after saving (a file keeps its format). A new recording or file replaces the old one only when you save.

   Audio 2, just below, works the same way for the second recording, which plays after the first: ▶ **Current**, **Record** or **Re-record**, **Choose file…**, or drop a file on it. When a note has both recordings, **Swap Audio 1 and 2** exchanges them when you save, and **Undo swap** cancels it; save or drop any new recording before swapping.

   Choosing the voice. Each row has a **Voice** list beside its Record button. Each starts with its default from Settings. **How it's read**, under each row, holds the instructions the voice follows, such as its accent and pace; edit them for a slower or more natural reading, adding to them rather than replacing them, then record again. These choices carry over from note to note until you change language or leave the tab. To keep one, click **Save as default**, which appears beside the voice once it or its instructions differ from your default: it saves both for that language and recording. The line below a new recording names its voice. Recordings saved earlier don't keep a record of their voice, so their name can't be shown.

5. **Notes** — everything the card shows under **more**:

- the **analysis**: choose **Word analysis** or **Sentence guide** (the page suggests one), then **Analyze** or **Regenerate analysis**; the analysis shows in the **Preview** below — **Edit analysis (Markdown)** opens it for editing (and **Hide the Markdown** closes it again), or **Remove analysis**;
- **dictionary entries** *(Japanese)* — instead of an analysis, or as well: **Add dictionary entries** looks them up, no AI. With **Word analysis** selected you get the word's JMdict entries (reading and senses) and each of its kanji with other words that use it; with **Sentence guide** selected, only the hard parts: the hardest kanji and the words that use them or aren't everyday words. They're listed for editing first — click into any line (a word, its reading, a sense, a kanji's meanings and readings, a compound) to change it, or × to leave it out — and **Save changes** saves what's left, right under the reading. To add a particular word from the card's text, select it, right-click → **Look up**, and click **Add to this card** in the box. **Edit dictionary entries** reopens entries already saved on the card for editing; **Remove dictionary entries** takes them off the card; **Look up dictionary entries again** starts over. A note saved with dictionary entries and no analysis counts as done for sessions (tag `pb::analyzed::japanese::dictionary`);
- each **brief explanation** (with its *Seen in* line): edit it, or **Delete** it;
- any **other notes** (e.g. written by hand in Anki) are shown and kept as they are — **Delete** removes them, and you can edit them under **Edit fields** → **Notes fields**;
- a **Preview** of exactly how it will look on the card.

6. **Add tags** *(optional)* — shows the note's current tags, and a tag picker for new ones: type part of any tag (`stt`, `tsp::5`, `glos`) and pick from the list with the arrow keys and **Enter**, or click it; a space or comma finishes a tag you type yourself. Chosen tags show as chips (× removes one); a tag that's new to your collection is marked *new*, and if it looks like an existing tag in another form — `STT32` when `source::STT::…` exists, `Temple` for `temple` — the chip offers the existing form (→ **source::STT::32?**). **Browse all tags** lists them by group (*source*, *diary*, …). The same picker is used wherever you add an item to Anki.

Every part you change is marked *changed*, and **Undo** puts it back as Anki has it.

Saving

Above the buttons, **Will save:** lists exactly what you've changed (e.g. *romanization, audio, analysis*). Only those parts are written — everything else on the card stays exactly as it was.

Button	What it does
Save changes & next	Saves what you changed and moves to the next note
Save changes	Saves and stays on the note — handy before branching (below)
Next (*Skip without saving* when there are changes)	Moves on
Clear flag & next	In a flagged session: just takes the flag off
Red flag / **Remove red flag**	Outside a flagged session: sets or removes Anki's red flag on the note's cards (as Ctrl+1 does in Anki), so you can come back to it under **Flagged in Anki**
Never analyze this note	Leaves it out of future sessions (still saves a ticked cleanup and the English note)
Edit fields	Edit the note's other language fields, Origin or Notes HTML right here (below)
Open in Anki	Opens the note in Anki's own editor (the window may open behind your browser)

Saving an analysis marks the note as analyzed. A note comes up in **Start session** until it's analyzed and its field is clean (or it's marked *Never analyze*); to work on any other note, use **Find** or **Review tag**.

Sending a card back from Anki: while studying in Anki, press **Ctrl+1** (on iPhone/iPad, use a flag button — see On your phone) on any card you want to edit or analyze in PolyglotBooster. Later, click **Flagged in Anki** on the Anki page to work through them. The red flag comes off automatically when you save anything for the note (**Save changes**, **Edit fields**, *Never analyze*), or click **Clear flag & next** if you only wanted to look. Typical fixes — a wrong romanization, a mispronounced recording, an analysis to correct — are all on the same screen.

Analyzing a note again replaces its previous analysis instead of adding a second one; anything else in the Notes field (such as a hand-written furigana reading) is kept.

Edit fields

Click **Edit fields** to change the note's language fields (English, Indonesian, Thai, Japanese, Spanish, French, Mandarin) or Origin, its **English note** (right under English, as plain text), or its other Notes (as HTML, under *Notes fields*).

- An empty language field says *filling it in adds its cards*, and has a **Suggest** button that proposes a translation from the note's other languages. Suggestions only fill the box — check them before saving.
- A new or changed language field gets a fresh recording (untick *Record new audio* if you don't want it).
- A new or changed Thai, Japanese or Mandarin field also gets its reading written into that language's Notes (untick *Write the reading* if you don't want it).
- **Save fields** writes only what you changed.

6.2 Branching: turning examples into new cards

A good analysis is full of useful material — example sentences, related words, casual and formal versions. Branching turns them into cards of their own.

Branch from examples (under the analysis preview)

1. The page lists every example, related word and register version in the analysis, with its reading, English, and a brief explanation — in the item's own language, with the same in English below it. Items you **already have in Anki** are marked *In Anki* and unticked.
2. Tick the ones you want (**Select all / none** helps), then **Start branch**.
3. For each item you can:
    - **Add note with brief explanations** — creates a note whose Notes field for that language has the reading, the explanation written in that language, and a *Seen in:* line pointing back to where you found it, and whose **English note** has the explanation in English (both are editable first, and previewed);
    - **Analyze fully** first, then **Add note with analysis**;
    - for an item already in Anki, **Add explanations to existing note** — the explanation block is added *after* everything already in its Notes field (any analysis stays untouched) and the English one on a new line in its English note — or **Add a new note anyway**;
    - **Skip**.
4. New notes get audio straight away and the tag `pb::branch`. When the list is done, **Back to main session** returns you to the note you branched from — with your unsaved work intact.

Right-click to add one item: select any text in the analysis preview, right-click it and choose **Add "…" to Anki…** to add just that phrase. If it's already in Anki you'll get the same choices as above. Or choose **Save "…" for Anki later** to keep it for later without stopping — see Saved for Anki later.

> Analyzing a note later is unaffected by brief explanations: **Analyze** and re-analysis only replace PolyglotBooster's own reading and analysis sections, and everything else in the field — explanations, your own notes — stays.

Ask a follow-up question: under the analysis preview, click **Ask a follow-up question** and type your question — for example, on *คุณควรบอกเขาก่อนเธอ* ("You should tell him before she does"), ask *How would you say "You should tell him before you tell her"?* — then **Ask** (or Ctrl+Enter). The answer appears below, with each Thai phrase in bold, its romanization and its English. Ask as many as you like; each answer takes the analysis and the earlier questions into account (uses the **Model**, **Level** and **Style** at the top of the page).

- Answers are **not saved** to the note, and nothing from them goes to Anki on its own. To keep a phrase, select it in the answer, right-click and choose **Add "…" to Anki…** (or **Save "…" for Anki later**) — it then works exactly like right-clicking in the analysis.
- The questions and answers stay while you branch and come back, and are cleared when you move to another note.

Branching from a branch: an item you've analyzed fully can itself be branched from (button or right-click). The deeper list is labelled *Branch · level 2*, and **Back to previous branch** takes you back up.

> Tip: click **Save** (not *Save & next*) on the main note first, then branch — your analysis is safely in Anki and stays on screen to branch from.

6.2a Tags

The **Tags** tab (next to *Review & analyze* and *Bulk audio*) tidies up your Anki tags in bulk, with a preview before anything changes.

- **Every tag** is listed with how many notes have it and their languages, grouped as *Dates*, *Already nested*, *Sources and other names*, *Topics and other words* and *Unclear*. Click a note count to see a few of its notes; **Filter tags** narrows the list. PolyglotBooster's own tags (`pb::…`) and Anki's `leech` are hidden and never changed (**show them** to see them).
- **Select tags** (tick boxes, or **select all** for a group), type a name, then:
  - **Rename to** — or **Merge into**, when several are selected (e.g. `STT22` and `STT-31` into `source::STT`);
  - **Nest under** — puts each under a parent (`temple` under `topic` → `topic::temple`);
  - **Delete** — removes the tag from its notes;
  - **Flag red & remove tag** — for tags used as a "look at this again" marker (e.g. `?`): every note with the tag gets Anki's red flag, so it comes up under **Flagged in Anki**, and then the tag is removed. (**Undo** brings the tag back; the flags stay until you clear them.)
- **Rules** handle many tags at once, one per line: `old → new` , where `*` matches any text and is carried over — e.g. `TSP-* → source::TSP::*` turns `TSP-2` … `TSP-60` into `source::TSP::2` … `source::TSP::60` . Several new tags are separated by spaces; nothing after the arrow deletes the tag. The first matching rule wins, so put specific rules first (`STT-*` before `STT*`). Lines starting with `#` are notes.
- **Fold date tags** turns `20180410` into `diary::2018-04-10` , and a name after the date into its own tag (`20200417Glossika` → `diary::2020-04-17` and `source::Glossika`); both parent names can be changed. Your notes' original creation dates are also back in Anki (the **Created** column in Browse), so the date tags are the lesson or course dates.
- **Preview** lists every change with its note count and why (a rule, the date rule, or chosen by hand — which wins over rules; **remove** drops a hand choice). **Apply** makes the changes in Anki; **Undo last change** reverses the most recent one exactly (it removes only tags that change added).

Make an Anki backup before a big change (*File → Create Backup*), and sync afterwards so your phone gets the new tags. Nested tags show as a tree in Anki's Browse sidebar, and a search like `tag:source::STT::*` finds a whole book — handy for custom study on your phone too.

6.3 Bulk audio

Records audio for every note that doesn't have it yet.

1. Tick the languages (Indonesian, Thai, Japanese, Spanish, French, Mandarin). English isn't recorded — it's the prompt side, and Anki would otherwise read it aloud in every review.
2. Each ticked language shows the voice it will use. To use another for this run, choose it from its **Voice** list; **Preview** plays a short sample (a tiny charge on your OpenAI key), and **How it's read** holds the instructions the voice follows. Add to those rather than replacing them, because they also set the accent. These choices last until you leave the tab. **Save as default** keeps them for that language and recording. For a smaller run, type or pick a tag under **Only notes with this tag**, e.g. `source::STT::24`. It includes tags under it, so `source::STT` covers every chapter. Leave it empty for all notes.
3. Click **Find notes needing audio**. You'll see how many clips are needed, with an estimated length and cost (roughly $0.015 per minute of audio — a thousand short clips cost about a dollar).
4. Click **Generate**. Keep the tab open; **Stop** at any time. Finished notes are tagged `pb::audio::<language>`, so the next run picks up where you left off.

Re-recording after changing a voice: tick **Replace existing audio too**, then find and **Re-record**. New recordings get new file names so they sync reliably to your phone.

Bulk audio never touches notes whose audio came from a textbook (see *Book audio* below), even when replacing.

Adding Audio 2 in bulk: under **Recording**, choose **Audio 2**, then find and generate as above. Each note that has a first recording but no second one gets a text-to-speech recording in your Audio 2 voice; change it in the **Voice** list if you like. Notes whose first recording is a textbook or video clip are included, and that clip stays as it is. With **Replace existing Audio 2 too**, textbook and video clips already in Audio 2 are kept, but an Audio 2 you added from your own file in *Review & analyze* is replaced.

6.3a Book audio

If your textbook comes with recordings, **Book audio** puts them on the chapter's notes in place of the text-to-speech audio. It's for notes already in Anki — for example a chapter you turned into cards with *Make flashcards*. (For a new chapter, add the recordings while sending the cards instead — see Flashcards to Anki.)

1. Pick the **Language**, type the chapter's **tag** (e.g. *source::STT::24*) and choose where the clips go under **Put clips in**: **Audio 1** replaces the text-to-speech recording, while **Audio 2** keeps it and adds the book's clip as a second recording that plays after it (handy for listening notes). Then **Load notes**.
2. **Add MP3 files...** and choose the chapter's recordings — or, if you've set a new recordings folder (see *Your audio folder* below), **Add from ... folder...** lists the MP3s saved there in the last 7 days: tick this chapter's and **Add**. If there are several, put them in book order by dragging them up or down the list (or with the ↑ ↓ buttons); they start sorted by file name.
3. Each file is split into one clip per sentence at the longer pauses, and the clips are matched to the notes **in the order the notes were added** — the order *Make flashcards* listed them, which follows the book. Notes for single words (e.g. ถ้า, ก็) are left out of the order, since recordings usually only have the sentences. They're listed under **Not in the recordings**: click **×** on one to put it back in the order (if your recordings include it), or pick a note from **Leave out another note...** when a word or phrase was taken for a sentence — the clips are matched again straight away. If the recordings read

the words too (rows show *no note* for word clips), click **Put all back**: once every clip is transcribed, each goes with the note it sounds like, so the words that aren't recorded are simply skipped.

4. Each clip is transcribed with your OpenAI key (a fraction of a cent per chapter) and compared with its note: ✓ **matches**, **≈ close** or ✗ **doesn't match**. Once every clip is transcribed, each one goes with the note it sounds like, still in book order — so a word note that isn't in the recordings, or a recording with no note, doesn't shift every row after it (the page says so when this changed the matches). A clip that can't be transcribed is tried twice more, then placed by order between its neighbours; so is one heard as another language (a short word sometimes comes back in Korean script), which the table marks. When a clip still sounds like a different note, **Use that note** moves it there.
5. Check the table: ▶ **Book** plays the clip, ▶ **Current** the note's audio now. Change a row's note with its menu, or untick **Use** to skip it. If the number of clips and notes differs, try a different **Pause between sentences**.
6. **Replace audio on N notes** (or **Add as audio 2 on N notes**) writes the clips to Anki. Clips put in Audio 1 tag their notes `pb::book-audio::<language>`. If you've chosen an audio folder, the recordings and clips are saved there too (see below); **Save to … only** saves them without touching Anki.

Your audio folder. Book audio can keep every chapter's recordings in a folder on your computer, so you can use them outside Anki (e.g. to make your own listening playlists). Under the tag, click **Choose folder…** next to **Audio folder** and pick a folder, e.g. *Documents\Thai audio*. It's remembered in this browser; **Change** picks another. The browser only tells the page the folder's name, not where it is, so to see the full path on the page, paste it into the box next to the name (copy it from File Explorer's address bar); **Edit path** changes it. When you replace a chapter's audio, the app saves:

- the downloaded recordings in a folder named from the tag — *source::STT::27* becomes **STT-27** — with the chapter added to the front of each name (*STT-27-khwaam-male.mp3*), so there's nothing to rename beforehand;
- the clips in **STT-27\clips**, numbered in book order and named after what's said, e.g. *STT-27-05 ความรักทำให้คนตาบอด.mp3*. Clips from a female recording end in *(female)*.

The first time, and sometimes when you come back, Chrome asks to let PolyglotBooster edit the folder; choose **Allow** (or **Allow on every visit** if it's offered). This works in Chrome and Edge on a computer.

Optional: a folder for new recordings. Chrome won't let web pages open your Downloads, Desktop or Documents folders themselves (it says the folder contains system files), but a folder inside them is fine. Make one for new recordings, e.g. *Downloads\New audio*, and save the book's audio downloads there (in Chrome, right-click a download link → **Save link as…**, or turn on **Settings** → **Downloads** → **Ask where to save each file**). Then click **Choose…** next to **New recordings folder** and pick it, to get **Add from New audio folder…** instead of the file picker. Tick **Remove recordings from it once they're saved in the chapter folder** to have them moved rather than copied: they're deleted from that folder only after they've been saved in the chapter folder.

Chapters done before you set the folder. Load the chapter's notes, choose the recording (**Audio 1** or **Audio 2**), and click **Save this chapter's audio N clips from Anki**: the book clips already on those notes are saved to the chapter's **clips** folder, in the order the notes were added.

Only MP3 files can be split. Notes that get book audio keep it: Bulk audio skips them, and editing their text doesn't re-record them. Recording or choosing new audio for one in *Review & analyze* removes the tag.

6.3b Listening notes

A **listening note** is a paragraph to listen to. Its card has no text on the front, just the recordings, so you practise understanding by ear:

- **Front:** both recordings play, with a 2-second pause between them. Under them are buttons for each recording: ↺**10** and ↺**5** (back 10 or 5 seconds), ▶ (play/pause) and 🔁 (loop until you tap it again). To pause or stop the recordings Anki plays by itself, use Anki's own audio controls (see Listening practice).
- **Back:** the text, and the first recording plays again. **more** shows the English translation (and any notes).

To make listening notes, open the **Listening** tab:

1. If you saved text with **Save for listening** on the study desk, it's listed under **Saved for listening**. Click **Use** to put it in the paragraphs box and set the language. It's removed from the list once all its notes are added; **Delete** removes it sooner.
2. Pick the **Language**, and optionally a **Tag** (e.g. *source::Genki::L3*) to study the set together later.
3. Under **Second recording**, choose **Another voice** (the paragraph is recorded twice, in two different voices) or **None** (add the textbook's recording later with Book audio → *Audio 2*).
4. Paste the paragraphs (or edit the saved text), with a blank line between them, and click **Prepare**. Each paragraph gets a suggested English translation; edit any you like and untick any you don't want. Paragraphs already in Anki as listening notes are marked and left out.
5. Click **Add N listening notes**. They go into **Polyglot::Listening::***Language* with their recordings, tagged `pb::listening`.

A listening note only makes the listening card, not the usual language-direction cards. Any note can have a second recording, though, and on ordinary cards it plays after the first.

Listening cards for notes you already have. Any note with audio can get a listening card too, and it keeps its usual cards. At the bottom of the **Listening** tab:

1. With the **Language** chosen above, optionally type an **Anki search** to narrow the notes, e.g. `tag:source::STT::22` for one chapter. Leave it empty for every note in that language with audio.
2. Click **Find notes**. Notes that already have a listening card are left out. Untick any you don't want (**Select all / none** help with long lists).
3. Click **Give N notes listening cards**. Each gets a listening card in **Polyglot::Listening::***Language* and the tag `pb::listening`. Its other cards and their review history don't change.

A note with audio in two learning languages (e.g. Indonesian and Thai) gets a listening card for each; the list marks these notes with *(also …)*. To take a note's listening card away again, clear its *Listening* field in Anki and run **Tools** → **Empty Cards**.

See Listening practice for studying them by hand or hands-free.

6.3c Phrase clip transcripts

Phrase clip transcripts makes sentence cards from a short recording, using the recording's own audio. You don't need a transcript, so it suits audio captured from a video. First choose what kind of recording it is:

- **Repeated phrases:** a teacher says each phrase more than once, for example fast at a natural pace and then slowly. The first saying goes in the card's first recording and the first clearly slower one in its second, which plays straight after it.
- **Monologue:** one person talking, saying each sentence once. The AI finds the sentences, and each one's audio goes in the card's first recording.

Repeated phrases

1. Pick the **Language** and click **Choose a recording…** to choose an MP3, M4A or MP4 file of up to 15 minutes. It's cut at its pauses on your computer; you'll see how many pieces it made and what transcribing them costs (with your OpenAI key, about a cent for a two-minute clip).
2. Click **Find the phrases**. Each piece is transcribed, and any text heard more than once becomes a phrase. Things said only once, like "Number one" or the English translation, are left out.
3. Check each row. Press ▶ **Play** on **Audio 1** and **Audio 2**, and choose another piece from the list if one is wrong: the fast and slow sayings are told apart only by their length. You can also correct the text or untick a phrase. **All pieces** shows what was heard in each one, and **New phrase** makes a phrase from a piece the search missed.
4. Optionally, tick **Also make one listening card from the whole recording** (see below), say where it's from and add a tag, then click **Prepare N cards**. The AI writes each card's romanization or reading, English and short notes.
5. Choose the cards to add, as with Flashcards to Anki: work through them one at a time, or **Add all**.

Monologue

1. Choose the file as above, and pick which AI should find the sentences under **Write sentences and notes with**.
2. Click **Find the sentences**. Each piece is transcribed, the AI decides which neighbouring pieces belong together, and any joined sentence is transcribed again as a whole, which is usually more accurate.
3. Check each row. Press ▶ **Play**, correct the text if needed, and untick anything you don't want, such as a greeting or sign-off. **Select all · none** above the table ticks or unticks every row: for example, coming back from the cards to add, click **none** and then tick only the rows you want to change and add again. **Join with next** puts two rows together, and **Split into its N pieces** breaks a joined sentence back into its pieces (and goes back to what was heard in each, undoing any corrections to it).

Several sentences in one row. When the speaker runs sentences together without a pause, they come out as one piece, which can't be split into pieces. Put each sentence on its own line in the row's text, then click **Split audio into N (one per line)**: the audio is cut at the quietest moment near where each line should end, judged by how much of the text comes before it. Play each new row. If a sentence's audio ends too early or too late, use **End: − 0.2 s · + 0.2 s** on that sentence: each click moves its ending by 0.2 seconds and plays it again, and the next sentence starts where it now ends. (For example, if line 8 stops before its last word, click **+ 0.2 s** on line 8 until it's included.) **Join with next** puts them back together.

4. Optionally, tick **Add text-to-speech as Audio 2** for a clearer version that plays after the speaker. It's recorded with your OpenAI key and the voice in Settings.

5. Optionally, tick **Also make one listening card from the whole recording**. See below.

6. Continue from step 4 above: **Prepare N cards**, then choose the cards to add.

One listening card for the whole recording. This works in both modes. If you ticked the box, a **Listening card** panel appears above the cards to choose. Its first recording is the whole clip, from the first words to the last, and its second is text-to-speech of the text. On the back of the card, the text has one sentence per line (with **Repeated phrases**, each phrase once on its own line, however many times it's said), and **more** shows the English for each line the same way. Every sentence or phrase is included, even ones you unticked for their own cards, because they're all in the audio. Play the recordings, edit the text and English if you like (keeping one sentence per line), check its tags (it starts with any from **Tag every card**), and click **Add listening card**. Add it before leaving that screen. It goes into **Polyglot::Listening::***Language* and makes only the listening card, separately from the sentence cards.

If it doesn't split well. Change **Pause between pieces** and click the find button again. The default is 0.5 seconds for repeated phrases and 0.3 for a monologue. A pause is worked out from how loud each recording's speech is, so light background sound shouldn't get in the way, but loud music or several people talking may not split well. Very short sentences are the likeliest to be misheard, so listen as you check the text. Cards made this way keep their recordings: Bulk audio leaves them alone.

Send to Anki from the study desk

On a result or saved review (Indonesian, Thai, Japanese, Spanish, French or Mandarin explained in English), click **Send to Anki**:

- If a note with exactly that text exists, it's updated — the analysis is added under its Notes, and audio if it has none.
- Otherwise a new note is created. It suggests the **English** meaning for you to edit (every card pairs with English), and adds a reading and audio.

Everything is shown for review before anything is written.

Right-click to add a phrase from the study desk

On a result or an expanded saved review (same languages, explained in English), select any phrase — in the result, a follow-up answer or the source text — then right-click and choose **Add "..." to Anki...** (or **Save "..." for Anki later** — see Saved for Anki later). The same item screen as on the Anki page opens right there, under the result: the phrase with its reading, English and brief explanations (in its own language and in English), a *Seen in:* line pointing back to the source text, the *In Anki* check with its choices, tags and audio. **Add** or **Skip**, and you're back where you were; right-click the next phrase to add another. Only text in the review's language can be added, and it needs Anki open on this computer.

Right-click to look up Japanese

Select Japanese text and right-click → **Look up "..."** to see its dictionary entries in a box next to the click — the same entries as **Add dictionary entries** on the Anki page, no AI: for a word, its JMdict entries (reading and senses) and each kanji with other words that use it; for a sentence, only its hardest kanji and harder words. It works on the study desk (the text box you type or paste into, when the source language is Japanese, and a Japanese result, follow-up answer or expanded saved review, whatever the explanation language) and on the Anki page (the card's Japanese text, the analysis preview, follow-up answers and the item screen). It doesn't need Anki.

Inside a box, select any text — a compound in a kanji's list, a word in a sense — and right-click → **Look up** again: a new box opens on top, as deep as you like. The same menu has **Copy** (Ctrl+C works too). On a card being added to Anki, each box also has **Add to this card**. × or **Esc** closes the top box; clicking anywhere else on the page closes them all.

Saved for Anki later

Save phrases while you study and add them to Anki later — without interrupting yourself, and from your phone or iPad too.

- **Saving:** on the study desk (a result, a follow-up answer or an expanded saved review) or on the Anki page (the analysis preview or a follow-up answer), select a phrase, right-click and choose **Save "..." for Anki later**. On an iPhone or iPad, just select the text: a **Save "..." for Anki later** bar appears at the bottom of the screen; tap it. A message confirms how many are waiting. The list is kept in your PolyglotBooster account, so it's the same on every device and stays until you deal with it.
- **From any app:** copy it, then on the study desk's **Utilities** tab tap **Save clipboard for Anki later** — see Utilities.
- **Seeing the list: Saved for Anki later (N)** on the **Utilities** tab lists every saved phrase with its language, where it came from and the date; **Delete** removes one. This works on any device.
- **Adding to Anki** (on the computer running Anki): on the Anki page's **Review & analyze** tab, pick the language and click **Saved for later (N)**. The button appears only when that language has saved phrases; phrases in other languages are listed under the buttons, and clicking one switches to that language and opens its list. Each phrase is looked up in the context you saved it from — reading, English and brief explanations — and the usual list opens: **Start branch** to go one at a time, or **Add**

all N with brief explanations. For each phrase: add it (it then leaves the list), **Skip, keep for later** (it stays), or **Delete from list**. In the list, **Delete the N unticked from the list** clears phrases you've decided against (e.g. ones already in Anki); unticked phrases otherwise stay saved.

Flashcards to Anki

After **Make flashcards** or **Make flashcards (selective)** (Indonesian, Thai, Japanese, Spanish, French or Mandarin, explained in English), click **Send cards to Anki**. A long text can take a few minutes; if it's too long to finish in one run, you get every card up to that point and a message naming the last one — run the task again on the rest of the text. Then:

1. Optionally say where the cards are from, e.g. *Speak Thai Today, chapter 22* — it's added to each note as a *Seen in:* line.
2. **Tag every card** fills in a tag from that name, nested under *source* (e.g. *source::STT::22*); change or add tags with the tag picker. Every note in the batch gets it, so you can study the set together later — see Studying one chapter or set.
3. **The book's audio (optional).** If the book comes with MP3 recordings, tick **Add the book's audio recordings (MP3) instead of text-to-speech** and add the chapter's files. They're split and matched to the cards in order, with the same checks and table as Book audio — vocabulary cards are listed under **Not in the recordings** and left out of the order, and you can change that list the same way. The button then reads e.g. **Choose cards (13 with book audio)**. With an audio folder chosen (the same settings as in Book audio), **Choose cards** also saves the recordings and clips to the chapter's folder, named from the tag.
4. **Choose cards** shows the list with each card's type (*Vocabulary* or *Sentence*), reading and meaning. Cards you already have in Anki are marked *In Anki* and unticked; **Also tag the unticked cards already in Anki** (on by default) gives them the batch tag too, so the set is complete. Use **Select all / none** and the checkboxes, then **Start branch**.
5. Each card then opens in the same editor as branching: **Add note with brief explanations**, **Analyze fully** first, add its explanations to an existing card, or **Skip**. The card's topic tags are filled in for you and can be edited. New notes get audio straight away: the book's clip for cards marked *Book audio* in the list (tagged `pb::book-audio::<language>`, so Bulk audio leaves it alone), text-to-speech for the rest. Adding a book-audio card's explanations to a note already in Anki puts the clip on that note too.

Japanese: dictionary entries on cards. The card editor has the same dictionary entries as the Anki page, saved under the reading in *more*:

- **Add dictionary entries** — one click: for a word card, its JMdict entries and each kanji with other words that use it; for a sentence card, only the hard parts.
- **From a word in a sentence** — select the word in the Japanese field or the dictionary panel, right-click → **Look up**, and click **Add to this card** in the box (also from a box opened inside another box). Entries from several words collect in the same list.
- **Edit before saving** — every line is editable in place, and × leaves it out. The preview shows exactly what will be saved.

- **For a whole list** — tick **Add dictionary entries to the N word cards** above **Start branch**: **Add all** saves every word card with its entries, and working one at a time, each word card opens with them already filled in, ready to trim.
- For a card already in Anki, the entries replace any dictionary entries that note has.

A count above the cards shows how many there are — e.g. *23 cards — 18 vocabulary, 5 sentences — from 6 paragraphs* — and updates as you remove or add cards, so you can judge how selective to be. You can check and edit every card on the study desk right after the run — front, back, reading, both explanations and tags — before saving the result for review or sending it to Anki. Each card from **Make flashcards** comes with its reading (romanization for Thai, hiragana for Japanese, pinyin for Mandarin; none for Indonesian, Spanish and French) and a brief explanation written in the source language — both go in that language's Notes — plus the same explanation in English, which goes in the English note.

Adding a long list quickly: instead of **Start branch**, click **Add all N with brief explanations** to add every ticked card with the defaults — a new note with its reading, explanations, *Seen in* line, tags and audio, or, for a card already in Anki, its explanations added to that note. Midway through a one-at-a-time session, **Add the remaining N with brief explanations** does the same for the rest. A progress bar shows how far it's got, and **Stop** returns you to one-at-a-time. Fix any card later in Anki, or find it on the Anki page.

Picking up where you left off: if you close the list partway through, just open **Send cards to Anki** again on the same result or saved review. Cards you've already added show as *In Anki* and start unticked, so the ones still to do are ticked (anything you skipped is ticked again too).

Turning a textbook chapter into cards

1. On the study desk, set **Source** to the language and **Explain through** to English.
2. **Upload document**, choose **AI reader**, click **Choose documents** and select all the page photos at once (name them so they sort in page order). Each page is read and added to the text box.
3. Choose **Make flashcards** and **Run task**. Check the cards, remove any you don't want.
4. **Send cards to Anki**, enter the book and chapter (the tag, e.g. *source::STT::22*, is filled in for you), pick the cards, and work through them.
5. If the book has recordings, tick **Add the book's audio recordings** in step 4's form so the cards get them straight away. For a chapter already in Anki, use **Book audio** on the Anki page instead.

7. Studying your cards in Anki

Studying

Click a deck in Anki (e.g. **Polyglot::Thai**) and **Study Now**. Show the answer, then rate how well you knew it — Anki schedules the next review. Click **more** on a card to see the reading, analysis and comments.

Studying one chapter or set

To study only the cards from one batch — say everything tagged *source::STT::22*:

1. In Anki, **Tools** → **Create Filtered Deck**.
2. Search: `tag:source::STT::22` — or `tag:source::STT::*` for the whole book, or `tag:source::STT::22 tag:prepositions` for just part of a chapter. Set the limit high (e.g. 1000) and leave *Reschedule cards based on my answers* on.
3. **Build**, then study it like any deck. When you're done, **Empty** the filtered deck and the cards return to their usual decks.

On your phone (AnkiMobile): open the parent **Polyglot** deck (so every sub-deck is included), then **Custom Study** and one of the tag options — *Learn new cards with certain tags* for a freshly added chapter, *Review due cards with certain tags* for daily study, or *Preview all cards with certain tags* to go through every card without affecting scheduling — and choose the tag. AnkiMobile builds a temporary filtered deck for you. Alternatively, build the filtered deck on your computer and sync; it appears on the phone.

You can also search for the *Seen in* text, e.g. `"Speak Thai Today, chapter 22"`, but the tag is more reliable: it also covers cards that were already in Anki. In PolyglotBooster's review sessions, type `tag:source::STT::22` into **Narrow with an Anki search** to work through just that set.

On your phone

Install **AnkiMobile Flashcards** by Ankitects (iPhone/iPad, paid) or **AnkiDroid** (Android, free), sign in with your AnkiWeb account, and sync. (*AnkiApp Flashcards* is an unrelated app that doesn't sync with Anki.)

Flagging on AnkiMobile: there's no flag icon by default. In AnkiMobile's review settings, add a button (or a tap/gesture) for **Flag 1 (red)**; tapping it during review flags the card, and the flag syncs to your computer for **Flagged in Anki**. Sync on your computer after working in PolyglotBooster, then sync on your phone — the notes and audio come across. (PolyglotBooster's Anki page itself only works on the computer running Anki.)

Previewing a card from the Browse window

In Anki's **Browse** window, select a note and press **Ctrl+Shift+P** (or click **Preview**). Space shows the answer. Switch the list from *Notes* to *Cards* to choose a particular direction. Previewing doesn't count as a

review.

Listening practice

Study a **Polyglot::Listening::***Language* deck in one of two ways. Which way is set on the deck, not the notes.

By hand (the usual way). Study the deck like any other. Both recordings play; replay one, go back 5 or 10 seconds, or loop it with the buttons under it, then press space (or *Show Answer*) to see the text and hear the first recording again. Rate the card to move on.

Pausing the recordings Anki plays by itself. The buttons on the card control their own playback, not the recordings Anki starts automatically. To pause those:

- **AnkiMobile (iPhone/iPad):** in AnkiMobile's preferences, assign **Pause Audio** (and, if you like, **Current Audio -5s**) to the top bar or to a tap or swipe. They're also in the study screen's tools (the gear icon). *Pause Audio* stops the recording and starts it again where it left off.
- **Anki on a computer: More** → **Pause Audio** during review, or its keyboard shortcut shown in that menu; **Audio -5s / +5s** are there too.
- Pressing space to show the answer also stops the front's recordings.

Hands-free. Anki's **Auto Advance** runs the deck for you: play both recordings, show the text and play the first again, then go to the next card.

1. Give the listening deck its own options preset (deck ⚙ → **Options** → add a preset, e.g. *Listening*), so your other decks aren't affected.
2. Under **Auto Advance**, turn on **Wait for audio**, set **Question action** to *Show Answer* and **Answer action** to *Answer Good* (or *Bury Card* to go through each card once). Set *Seconds to show question/answer for* to a short pause, e.g. 2.
3. Start studying the deck and turn on Auto Advance from the **More** menu (Shift+A on a computer). On a phone, it's in the review screen's menu. It runs until you turn it off or the deck runs out.

To keep looping through the same paragraphs without changing their review schedule, make a **filtered deck** (*Tools* → *Create Filtered Deck*, search `deck:"Polyglot::Listening::Japanese"`, or `deck:"Polyglot::Listening"` for every language). Turn off *Reschedule cards based on my answers* and give *Good* a short delay. With Auto Advance answering *Good*, each card comes back after the others. **Empty** the filtered deck when you're done.

Auto Advance works for ordinary decks too, as a listening drill.

Tidying up media

After re-recording audio, old clips remain in Anki's media folder. **Tools** → **Check Media** lists unused files and can delete them.

8. Troubleshooting

Problem	What to do
"Can't reach Anki" on the Anki page	Make sure Anki is open, AnkiConnect is installed, and the app's address is in `webCorsOriginList` exactly as in 5.3 (restart Anki after changing it). If you use the installed app, its address is still `https://polyglotbooster-v2.vercel.app`.
AnkiConnect config won't save	The list needs commas between items (but not after the last one).
Browser asks about "local network"	Click **Allow** — it's how the page reaches Anki on your computer.
"Add your … API key"	Add a key for the selected provider in **Settings**, or switch provider. Audio always needs an OpenAI key.
"Your credit balance is too low"	The AI provider's prepaid credit has run out: add credit in its billing page (see API keys), or switch **Provider** on the study desk. Credits also expire a year after purchase.
Open in Anki does nothing	The Anki window probably opened behind your browser — check the taskbar/dock.
A card has no audio	Run **Bulk audio**; it records anything missing.
A romanization or suggestion looks wrong	Edit it before saving — every generated text is editable.
Changes don't appear on your phone	Sync in Anki on the computer, then on the phone.
Something's off after an update	Reload the page (the ⟳ button in the installed app).

9. Reference

Languages

	Study desk	Anki page
Indonesian, Thai, Japanese, Spanish, French, Mandarin	✓	✓ (analysis, audio, branching)
English	✓	✓ (the meaning side of every card)

Tags PolyglotBooster adds in Anki

Tag	Meaning
`pb::analyzed::<language>::<task>`	The note has an analysis (and which task made it)
`pb::audio::<language>`	The note has a recording for that language
`pb::book-audio::<language>`	The recording is the textbook's own (added with *Book audio*); Bulk audio leaves it alone
`pb::skip::<language>`	You chose *Never analyze this note* — remove the tag to bring it back
`pb::branch`	The note was created from another note's analysis (see its *Seen in:* line)
`pb::listening`	The note has listening cards (a paragraph made on the *Listening* tab, or a note given a listening card there)

Search for them in Anki's Browse window, e.g. `tag:pb::branch`.

Dictionary data

Besides the dictionary panel, the curated dictionary steers the AI for Japanese:

- **Word Analysis Japanese** (study desk or Anki page) gives the AI the word's dictionary entry — readings, senses and kanji — as the authority: the analysis uses those readings and builds its meanings on those senses, adding nuance, related words and examples, and says so when your text uses a sense the dictionary doesn't list. Its **Kanji** section gives each kanji's meaning and reading here, then 2–3 other common words that use it, taken from the dictionary's compounds.
- **Sentence Guide Japanese** gives the AI every dictionary word in the sentence, with its reading and main senses, and its hardest kanji with their compounds; its **Kanji** section explains only those (and is left out when there are none). Sentences are split into words with *kuromoji*, a Japanese word splitter, which also finds a conjugated word's dictionary form (行きました → 行く, 呼ばれる → 呼ぶ) and keeps compounds whole (神仏分離, お会式).
- **Make flashcards (selective)** gives the AI the text's dictionary words with JMdict's **common word** marker, and asks it to leave everyday words out and choose vocabulary mainly from the rest — an

objective filter. On a 46-paragraph article about 永寿院 and 池上本門寺, the full **Make flashcards** made 135 cards; the selective one made 22, all specialised vocabulary (子院, 寄進, 帰依, 本尊, 神仏習合 …) plus a few key sentences.

- **Readings for a single word** (e.g. when a Japanese field is filled in, or a reading is regenerated) come straight from the dictionary when it gives the word only one reading — exact, and no AI cost. When a word has several readings that depend on context (上手: じょうず, うわて, かみて), the AI chooses.
- **Make flashcards** (both kinds): a word card whose reading isn't one the dictionary gives that word is corrected to the dictionary's (e.g. 塔頭 *とうとう* → *たっちゅう*, お会式 *おかいしき* → *おえしき*); readings the dictionary allows are kept.

The hardest-kanji rule (for a sentence or passage): a kanji counts as hard when it's beyond the 1,026 taught in Japanese elementary school (grades 1–6) — that is, a secondary-school jōyō kanji, a name kanji, or one outside both lists. Up to **5** are kept, hardest first: kanji outside the lists, then name kanji, then secondary-school jōyō, and rarer before more frequent (by newspaper frequency). The words picked for dictionary entries are those using one of these kanji or not marked *common* (at most 8, hardest first). The rule uses KANJIDIC2's grade and frequency data.

Example compounds for each kanji are JMdict words written only in kanji (2–4) that contain it: words marked *common* first, then words with example sentences or several senses, two-kanji words before longer ones, and words whose other kanji are frequent; archaic, rare and katakana-read words are left out. Up to 10 are kept per kanji.

The Japanese dictionary uses **JMdict** (about 219,000 entries) and **KANJIDIC2** (about 10,400 kanji) from the Electronic Dictionary Research and Development Group, used under their licence (Creative Commons Attribution-ShareAlike 4.0). Example sentences come from the Tatoeba project (CC BY 2.0 FR), as linked to JMdict senses; Japanese text is split into words with kuromoji (Apache 2.0) and its IPADIC dictionary. The data comes from the jmdict-simplified project's weekly release and is refreshed every time the app is deployed; the panel shows which edition it's using. The dictionary files are part of the website itself, so looking words up costs nothing and uses none of the app's storage allowance.

Privacy

- The text you study is sent to the AI provider you choose (Anthropic or OpenAI), using your own API key.
- Your API keys (encrypted), voice settings, saved reviews, their audio and your saved-for-later list are stored on the PolyglotBooster server, tied to your Google account.
- Your Anki collection stays on your computer (and AnkiWeb, if you sync). The Anki page talks to it directly from your browser; your cards aren't copied to the PolyglotBooster server.

Backups

PolyglotBooster's data — the task templates, saved reviews and their audio, the saved-for-later list, settings and encrypted API keys — lives in the app's Vercel storage. A backup copies all of it:

- **On your laptop:** `Documents\PolyglotBooster backups\<date>\`, everything including the encrypted keys. The newest 8 backups are kept.
- **On GitHub:** the private repository **PolyglotBooster-data**, everything except the API keys. Each backup is a commit, so earlier versions (e.g. a template before an edit) can be recovered there.

It runs **every Sunday at 8 PM** (Windows Task Scheduler, task *PolyglotBooster data backup*; if the laptop was off, it runs at the next chance). Each run is logged in `Documents\PolyglotBooster backups\backup.log`. To back up right away, run `npm run backup` in the PolyglotBooster project folder.

To restore — e.g. into a new Vercel storage after moving accounts — run `npm run restore -- "<backup folder>"` to see what would be uploaded, then add `--yes` to upload it. Then re-enter your API keys in Settings if you restored from GitHub.

Keep a copy of the project's `.env.local` file (in a password manager): with it, the code on GitHub and a backup, the whole app can be rebuilt. Your Anki cards are backed up separately, by Anki and AnkiWeb.
